

M4T1 Solving Quadratic Equations

Name _____

<p>1 Polynomial Many terms.</p> $5x^3 - 3x^2 + 2x + \sqrt{6}$ <ul style="list-style-type: none"> - no fractional exponents - no negative exponents - no variables in the denominator - no variables under roots 	<p>2 Terms</p> $3x^2 + 5x + 2$ <p>After the expression is simplified a term is a product of factors and is separated by addition or subtraction</p>	<p>3 Coefficient, Base, Exponent</p> <p>Exponent small number</p> <p>Coefficient Number in front of the variable</p> <p>Base Number or variable raised to a power</p>	<p>4 Vocabulary</p> <p>Monomial – one term polynomial Binomial – two terms polynomial Trinomial – three terms polynomial</p> <p>Types of equations or functions</p> <p>Linear – highest exponent of 1 Quadratic – highest exponent of 2 Cubic – highest exponent of 3 Quartic – highest exponent of 4 Quintic – highest exponent of 5</p>																					
<p>5 Degree & Leading Coefficient</p> $4x^2 + 8x + 3$ <p>Degree - The highest exponent of a term or the highest sum of the exponents in a term. (degree of 2)</p> <p>Leading Coefficient – number in front of the term with the highest exponent. (leading coefficient is 4)</p>	<p>6 Adding Polynomials</p> <p>Only add like terms</p> <p>ex. $2x + 5x = 7x$</p> <p>ex. $9x^2 + 5x^3 - 2x^3 + 4x^2 = 13x^2 + 3x^3$</p>	<p>7 Multiplying monomials</p> <p>When multiplying, multiply the coefficients (numbers in front) and add the exponents with the same base.</p> <p>Ex. $2x \cdot 4x = 8x^2$</p> <p>Ex. $5x^4 \cdot 2x^2 = 10x^6$</p>	<p>8 Multiplying - distributing</p> <p>Multiply the factor in front of the parentheses by every term in the parentheses.</p> $5x(3x^2 + 2x - 4) = 15x^3 + 10x^2 - 20x$																					
<p>9 Multiplying binomials Distributing</p> $(x+2)(x-5) = x(x-5) + 2(x-5)$ $= x(x-5) + 2(x-5)$ $= x^2 - 5x + 2x - 10$ $= x^2 - 3x - 10$	<p>10 Multiplying binomials Multiplication table</p> <p>Multiply $(x-6)(x+3)$</p> <table border="1" data-bbox="638 1008 991 1166"> <tbody> <tr> <td>•</td> <td>x</td> <td>- 6</td> </tr> <tr> <td>x</td> <td>x²</td> <td>- 6x</td> </tr> <tr> <td>+ 3</td> <td>+3x</td> <td>- 18</td> </tr> </tbody> </table> <p>$(x-6)(x+3) = x^2 - 3x - 18$</p>	•	x	- 6	x	x ²	- 6x	+ 3	+3x	- 18	<p>11 Multiplying binomials – FOIL</p> <p>First Outer Inner Last</p> <p>F O I L</p> $(x+6)(x+7) = x^2 + 7x + 6x + 42$ $= x^2 + 13x + 42$	<p>12 Multiplying – Multiplication Table Expanded</p> <p>Multiply $(x+2)(x^2-3x+4)$</p> <table border="1" data-bbox="1583 1008 2053 1166"> <tbody> <tr> <td>•</td> <td>x²</td> <td>-3x</td> <td>+ 4</td> </tr> <tr> <td>x</td> <td>x³</td> <td>-3x²</td> <td>+4x</td> </tr> <tr> <td>+ 2</td> <td>+2x²</td> <td>-6x</td> <td>+8</td> </tr> </tbody> </table> <p>$(x+2)(x^2-3x+4) = x^3 - x^2 - 2x + 8$</p>	•	x ²	-3x	+ 4	x	x ³	-3x ²	+4x	+ 2	+2x ²	-6x	+8
•	x	- 6																						
x	x ²	- 6x																						
+ 3	+3x	- 18																						
•	x ²	-3x	+ 4																					
x	x ³	-3x ²	+4x																					
+ 2	+2x ²	-6x	+8																					
<p>13 Factoring – GCF GCF – Greatest Common Factor</p> <p>Divide out what each term has in common.</p> <p>Look for common numerical factors.</p> <p>Look for common variable factors.</p> <p>Look for common negative signs.</p>	<p>14 Factoring Trinomial – Signs</p> <p>If the constant is positive the signs in the binomial will be the same, both the sign of the linear term.</p> <p>If the constant is negative the signs in the binomial will be one negative and one positive.</p>	<p>15 Factoring $x^2 + bx + c$</p> <p>What multiplies to give you “c” but adds to give you b?</p> <p>Ex. $x^2 - 6x + 8 = (x-2)(x-4)$</p>	<p>16 Factoring $ax^2 + bx + c$ X FACTOR</p> <p>What multiplies to give you ac but adds to give you b. Divide by a, reduce, bottoms up.</p>																					

<p>17 Zero Product Property</p> <p>If $ab = 0$ then $a = 0$ or $b = 0$</p> <p>If two factors multiply to equal zero, then at least one of the two factors must equal zero.</p>	<p>18 Solving by factoring</p> <ol style="list-style-type: none"> 1. set equation equal to 0 2. factor the trinomial 3. set factors equal to zero 4. solve the factors 	<p>19 Solving by factoring</p> <p>Example: Solve $x^2 + 2x = 15$</p> $x^2 + 2x - 15 = 0$ $(x - 3)(x + 5) = 0$ $x - 3 = 0 \quad x + 5 = 0$ $x = 3 \quad x = -5$	<p>20 Difference of two squares</p> $a^2 - b^2 = (a - b)(a + b)$ <p>Two squares subtracting, always factors into the same binomials with different middle signs.</p>																														
<p>21 Perfect square trinomial</p> <p>Trinomial that factors into a perfect square.</p> $16x^2 - 24x + 9 = (4x - 3)^2$ <p>Perfect square Perfect square Square root 1st term Square root last term</p> <p>Double those square roots. Middle sign</p>	<p>22 Sum of two cubes</p> $a^3 + b^3 = (a + b)(a^2 - ab + b^2)$ <p>First parenthesis is the same without the cubes. Second parenthesis, first term squared, opposite of product, second term squared.</p>	<p>23 Difference of two cubes</p> $a^3 - b^3 = (a - b)(a^2 + ab + b^2)$ <p>First parenthesis is the same without the cubes. Second parenthesis, first term squared, opposite of product, second term squared.</p>	<p>24 Perfect squares & cubes</p> <table border="0"> <tr> <td>$1^2 = 1$</td> <td>$11^2 = 121$</td> <td>$1^3 = 1$</td> </tr> <tr> <td>$2^2 = 4$</td> <td>$12^2 = 144$</td> <td>$2^3 = 8$</td> </tr> <tr> <td>$3^2 = 9$</td> <td>$13^2 = 169$</td> <td>$3^3 = 27$</td> </tr> <tr> <td>$4^2 = 16$</td> <td>$14^2 = 196$</td> <td>$4^3 = 64$</td> </tr> <tr> <td>$5^2 = 25$</td> <td>$15^2 = 225$</td> <td>$5^3 = 125$</td> </tr> <tr> <td>$6^2 = 36$</td> <td>$16^2 = 256$</td> <td>$6^3 = 216$</td> </tr> <tr> <td>$7^2 = 49$</td> <td>$17^2 = 289$</td> <td>$7^3 = 343$</td> </tr> <tr> <td>$8^2 = 64$</td> <td>$18^2 = 324$</td> <td>$8^3 = 512$</td> </tr> <tr> <td>$9^2 = 81$</td> <td>$19^2 = 361$</td> <td>$9^3 = 729$</td> </tr> <tr> <td>$10^2 = 100$</td> <td>$20^2 = 400$</td> <td>$10^3 = 1000$</td> </tr> </table>	$1^2 = 1$	$11^2 = 121$	$1^3 = 1$	$2^2 = 4$	$12^2 = 144$	$2^3 = 8$	$3^2 = 9$	$13^2 = 169$	$3^3 = 27$	$4^2 = 16$	$14^2 = 196$	$4^3 = 64$	$5^2 = 25$	$15^2 = 225$	$5^3 = 125$	$6^2 = 36$	$16^2 = 256$	$6^3 = 216$	$7^2 = 49$	$17^2 = 289$	$7^3 = 343$	$8^2 = 64$	$18^2 = 324$	$8^3 = 512$	$9^2 = 81$	$19^2 = 361$	$9^3 = 729$	$10^2 = 100$	$20^2 = 400$	$10^3 = 1000$
$1^2 = 1$	$11^2 = 121$	$1^3 = 1$																															
$2^2 = 4$	$12^2 = 144$	$2^3 = 8$																															
$3^2 = 9$	$13^2 = 169$	$3^3 = 27$																															
$4^2 = 16$	$14^2 = 196$	$4^3 = 64$																															
$5^2 = 25$	$15^2 = 225$	$5^3 = 125$																															
$6^2 = 36$	$16^2 = 256$	$6^3 = 216$																															
$7^2 = 49$	$17^2 = 289$	$7^3 = 343$																															
$8^2 = 64$	$18^2 = 324$	$8^3 = 512$																															
$9^2 = 81$	$19^2 = 361$	$9^3 = 729$																															
$10^2 = 100$	$20^2 = 400$	$10^3 = 1000$																															
<p>25 Extracting perfect squares</p> <p>Break the radicand into factors that are perfect squares. Take the square root of the perfect squares.</p> <p>Examples:</p> $\sqrt{20} = \sqrt{4 \cdot 5} = \sqrt{4} \cdot \sqrt{5}$ $= \pm 2\sqrt{5}$	<p>26 Solving a Perfect Square</p> <ol style="list-style-type: none"> 1. Isolate the perfect square. 2. Square root both sides of the equation. (don't forget the \pm) 3. Solve the two equations. 	<p>27 Completing the square diagram</p> <p>Find "c" to make it a square</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td style="padding: 5px;">$b/2$</td> <td style="padding: 5px;">$(\frac{b}{2})x$</td> <td style="padding: 5px;">$(\frac{b}{2})^2$</td> </tr> <tr> <td style="padding: 5px;">x</td> <td style="padding: 5px;">x^2</td> <td style="padding: 5px;">$\frac{b}{2}x$</td> </tr> <tr> <td></td> <td style="padding: 5px;">x</td> <td style="padding: 5px;">$b/2$</td> </tr> </table> $x^2 + bx + ? = (x + ?)^2$	$b/2$	$(\frac{b}{2})x$	$(\frac{b}{2})^2$	x	x^2	$\frac{b}{2}x$		x	$b/2$	<p>28 Completing the square</p> $x^2 + bx + \frac{(\frac{b}{2})^2}{1} = (x + \frac{b}{2})^2$																					
$b/2$	$(\frac{b}{2})x$	$(\frac{b}{2})^2$																															
x	x^2	$\frac{b}{2}x$																															
	x	$b/2$																															
<p>29 Solving by Completing the square</p> <ol style="list-style-type: none"> 1. Isolate x^2 and x term 2. Make sure coefficient of x^2 is 1 3. Complete the square. 4. Factor into a perfect square. 5. Square root 6. Solve for x. 	<p>30 Solving by Completing the square – Example</p> $4x^2 + 8x - 32 = 0$ $4x^2 + 8x = 32$ $x^2 + 2x = 8$ $x^2 + 2x + \underline{\quad} = 8 + \underline{\quad}$ $x^2 + 2x + 1 = 9$ $(x + 1)^2 = 9$ $x + 1 = 9 \quad x + 1 = -9$ $x = 8 \quad x = -10$	<p>31 Quadratic Formula</p> <p>If $ax^2 + bx + c = 0$, then</p> $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$	<p>32 Discriminant</p> <p>When $ax^2 + bx + c = 0$ then $b^2 - 4ac$ is the discriminant.</p> <p>If $b^2 - 4ac > 0$, then two real roots or two real zeros. (perfect square – 2 rational, not perfect square – 2 irrational)</p> <p>If $b^2 - 4ac = 0$, then one real double root or one real zeros. (2 equal rational roots)</p> <p>If $b^2 - 4ac < 0$, then no real roots or no real zeros. (no real – imaginary)</p>
